

Current System Documentation

Company's Background

Parrot Books is a leader in the sale of quality books to a diverse and international group of clients. Taking advantage of the latest technological innovations, they deliver a wide range of books rapidly to anywhere in the world at competitive prices. The firm has 170 employees, annual revenues in 2009 of 14 million EGP and is a three times winner of the Sloop Book Distributorship award. They continually strive to improve our performance and relations with our customers, suppliers and the public. We intend to continue our high reputation in excellence, customer service and quality across all continents of the world. They are now using a manual System. You are required to perform Structured Analysis to represent the current system. Then consider that the company wants to move to a Web-based application, and perform Object-Oriented Analysis and Design for the new System. The tasks are described below.

Process Descriptions

Sales Order System

Receive and Validate Sales Order

When a sales order is received it must be checked by sales staff before it is approved for further processing. Customers will order books using information in the firm's catalogue. The following are examples of what can prevent it from being processed further as a sales order:

- The firm does not supply the book(s) ordered
- The pricing details on the order are incorrect

If the sales order is invalid, it is referred back to the customer. If it is valid, a check is made on stock levels for each item on the order. This is checked on a computer screen. If there is not enough stock in the Quantity on Hand, a Purchase Requisition is raised and sent to the Purchase Order System. Some of the data on the requisition comes from the Books data store while the rest is generated by sales staff. A different requisition is raised for books from different publishers. The accepted Sales Order is passed on for preparation of the acknowledgement.

Prepare and Despatch Acknowledgement

The sales staff will use the customer sales order document as a source document in entering the sales order onto their computer systems. The Books and Customers files will also be used to access data.

Once the sales order has been constructed on computer screens, its details are stored away on the sales order and sales order item files.

The sales order acknowledgement can now be printed and a copy sent to those parties that require a copy. When the acknowledgement is printed, there are basically two parts to the document - header and item detail. The header details refer to the whole order, e.g. the customer it is sold to, where it is to be sent, shipping and payment terms. The item details will consist of one line of data for each item on the order. Some of the item data is read from files while other data is calculated. The extended price is calculated by multiplying the quantity by the sales price. The order total is the sum of all the extended prices.

Copies of the acknowledgement are sent to the customer, the credit control department, the warehouse and a copy filed away in the sales department.

Prepare and Action Picking Ticket

The warehouse is notified of the need to despatch the sales order by the receipt of the sales order acknowledgement. For all the items on an order that are available in the warehouse, a picking ticket is printed. The firm only ships the complete quantity for an item and will not make part shipments of an item. If any are not available, the warehouse staff wait for stock to arrive and will be picked when available.

The picking ticket is generated on a computer screen by warehouse staff. They display details of the sales order and flag the items that are available. The details of the picking ticket are then stored away and the picking ticket is printed.

The warehouse staff will take the picking ticket, pick the goods from their location and pass them to the shipping department, along with the picking ticket.

Prepare and Action Despatch Note

Once the goods are received by the shipping department, they arrange for the goods to be shipped to the customer. They will generate a number of documents to accompany the goods to their destination. The minimum they must produce is a despatch note. This is produced on a computer screen using the picking ticket as a guide but also using other files to speed up data input.

Details of the despatch note are filed away and copies of the despatch note can be printed when required. One copy goes to the customer with the goods, one copy to the sales ledger department (so they can invoice the customer for payment) and one copy is filed away in the shipping department.

Sales Ledger System

Prepare and send out sales invoice

This process is triggered by the receipt of a despatch note from the Sales Order Processing System. The despatch note indicates that goods have been sent to the customer and that an invoice needs to be raised to ensure payment for the goods.

The invoice is prepared on a computer screen by using as many details from existing computer files as possible. These files currently include the Publishers and Books.

Once the invoice is completed, the nominal ledger and sales ledger is updated with invoice details. A copy of the invoice is sent to the customer and a copy is kept on file.

Prepare and send out customer statements

Once a month a statement is sent to customers for whom a transaction has occurred in the last month or for whom a balance is outstanding. This statement contains a list of invoices that require payment as well as a total balance outstanding. This statement serves two purposes:

- Reminds the customer that they have invoices to be paid.
- Gives the customer the opportunity to confirm their own records as being correct

The primary source of data for producing the statement is the sales ledger although other files such as the customers file are needed to ensure the statement is correctly addressed. A copy is sent to the customer and a copy is kept on file.

Compare cheque with remittance advice

A payment is normally sent in by a customer in the form of a cheque along with a remittance advice. The cheque is the legal payment and the remittance advice contains details of which invoices have been paid off by the customer.

When these payment documents are received by the firm they are checked to ensure that:

- They have been sent to the correct destination. This particularly important in a large firm (e.g. British Telecom) that is split into many business units that can receive and pay invoices.

- The cheque details and amount match those on the remittance advice.

If there are any discrepancies, the payment documents are returned to the customer.

If the documents are correct, invoices on the sales ledger are recorded as paid. The cheque is sent to the cashier for depositing in a bank and the remittance advice is filed away.

Prepare and submit bank deposit

The cashier in the accounts department will receive a number of cheques daily and will deposit them in the bank as a batch. He will prepare a deposit slip which contains details of the cheques and will submit this deposit slip with the cheques to the bank. A copy of the deposit slip is then used to update the nominal ledger (increasing the firms bank balance and decreasing the firms debtors balance). The copy of the deposit slip is then filed away to serve as a record of the cash receipts.
